CREATE A TABLE FROM EXISTING TEXT

There are times when it is necessary to insert existing text into a table so that the document will look more professional. A table may be created from existing text that is separated by paragraph marks, tabs, commas or some other type of character, such as a hyphen. To create a table from existing text, complete the following steps:

1. Open the document that is to be used to create the table.
2. Make sure each item in the line is separated by tabs, commas, paragraph marks, or other character.
3. There have to be the same number of separators in each row.
4. Therefore, if one row contains more items than another, tabs or commas or other characters have to be inserted to specify the items that need to go into each cell.

<tr>
<td></td>
<td>Joseph Klimenuk</td>
<td>500</td>
<td>12.50</td>
<td>6,250</td>
</tr>
<tr>
<td></td>
<td>Raymond Ling</td>
<td>450</td>
<td>12.50</td>
<td>5,625</td>
</tr>
</tbody>
</table>

> Select all of the text in the document.
> Be careful that you don’t select the paragraph marks above or below the text.
> Click the Insert Tab.
> In the Tables Group, click the Table arrow.
> Click the Convert Text to Table link.
> The Convert Text to Table dialog box will appear.
Enter the number of columns that are to be included in the table by clicking the scrolling arrows next to **Number of columns**.

- Normally, you would not want to change this.
- It defaults to the number of columns that were specified with the tabs or other characters used in the list.

Input the number of rows for the table by clicking the scrolling arrows next to **Number of rows**.

- This may default to the number of rows that have been selected.
- You may not be able to add a number to this box.

Select the **AutoFit** behavior that is to be used in the table. The options are:

- **Fixed Column Width** – This option is used to specify the width of the column. The width that is specified will remain static; it will not change as data is entered.
- **AutoFit to Contents** – To make the column width the size of the longest entry in the column, use this option. As text is entered into the column, the width will expand to the size of the entry.
- **AutoFit to Window** – This option automatically changes the width of a table to fit a Web page so it will fit the monitor width. This is the best option to use if you plan to convert the document to a Web page. The column width that is displayed in the Word document may not be the same as when the document is displayed on the Web unless the document is in Web Layout View.

Click the appropriate symbol to separate text into cells. The symbol is determined by how the information is input into the text document. The options here are:

- **Paragraphs** – The text that is being converted is separated by a paragraph mark.
- **Commas** – The text that is being converted is separated by a comma.
- **Tabs** – The text that is being converted is separated by tabs.
- **Other** – The text that is being converted is separated by a specified symbol, such as a hyphen.

When all the options have been chosen, click **OK**.

The text should appear in proper Table Format.

**NOTE:**

- If the columns don’t appear as they should, it means that there isn’t the same number of tabs, commas, or other character in each row of text.
- It is important that the same number of tabs, or other characters, is inserted into the text that is being converted.
- To remedy this, click the **Undo** button, deselect the text, and insert the necessary separators (commas, tabs) into the text, including ones at the end of a row of information, if necessary.
